

Technical Bulletin

Important information regarding the introduction of KFG housings with 100-120 slotted front mounting holes.

From January 2023, Knott-Avonride will no longer supply the KFG13, 20, 27 and 30 range of couplings with either 100mm or 120mm front mounting holes, instead the housings used will have slotted front holes (see image below). The slots allow for universal mounting with one assembly and the end customer no longer needs to be asked to measure the front hole centres, eliminating the possibility of identifying the incorrect overrun coupling hole centres. Purchasing of product will become more straightforward as the number of possible variants is halved. It also has the benefit of reducing inventory variation and stockholding for Knott, Customers and Suppliers.

The KFG35 housing will remain unchanged and retain a 120mm hole centre.
